

# back-end

## Review

lab-4b

# Assessment 1 - Individual

You've worked iteratively (*formative*) on your product and finish with an oral test (*summative*). You'll **show the feature** you've end based on your code in your repository and live version. *A teacher will try out your feature and look at the code.*

You will show you can create a quality project in which you apply the subject matter of this course and that you understand it.

You will answer questions in such a way as to demonstrate sufficient knowledge of our goals.

*This is an individual assessment, so tests will be conducted between one teacher and one student.*

**This is an assessment, not another moment for feedback.** So you will be graded. There isn't much time for additional feedback or troubleshooting technical issues.

## Preparation

Since we have limited time make sure you come to the assessment prepared:

- **Bring your computer** and make sure it's *charged* and connected to *Wifi*.
- Make sure your *webcam, microphone* and *screen sharing* works in **MS Teams**
- Have the latest version of your feature **ready in your browser**.
- Have the latest version of your code **ready on GitHub**.

look at the **rubric for A1**

# Questions?

*Show what  
you did*

# Review

---

In the lab we'll do a **peer review** by having a look at the assessment checklist and grading fellow students based on the rubric. After that teachers have time to answer questions and do some technical troubleshooting.

## A1 peer review:

This is the peer review document you will fill-in as duo. You'll perform the checks on the project of your fellow student. It's a good last check to see if everything is in order.

→ [Peer Review](#)

## A1 rubric:

This is the rubric your teacher will grade you on during the assessment. Ask yourself upon completion if everything listed on the rubric is clear and that you understand each row and column, if not ask your teacher on MS Teams!

→ [Rubric](#)

## Questions:

If you have any question you can reach the student-assistants and teachers on MS Teams. Make sure you are prepared:

do the **peer review A1**

# Assessment

---

Based on your repository, source code and local version you show what feature you've created for back-end. The idea is not to present your feature, **a teacher will look through the code and ask questions**. By answering questions you demonstrate sufficient knowledge of our code. *This is an individual test, so they will be conducted between one teacher and one student.*

→ [Read more about Assessment 1](#)

→ [Go to the scheduler on Brightspace](#)

## 🔗 Hand-in

---

Make sure you hand-in your work in the assignments `a1` slot on Brightspace.

- A link to your *repository*
- A `zip` file of your code (for archive purposes)

finish your **prototype for A1**

**exit;**

see you in **A1!**
